IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

APPLICATION FOR LETTERS PATENT

Method and Apparatus for Media Access Control

Inventors:

Mark J. Radcliffe

Kathleen E. Demaree

Nadja Vol-Ochs Wilson

ATTORNEY DOCKET NO. MS1-1459US

1 **TECHNICAL FIELD**

2 The systems and methods described herein relate to accessing media data
3 from one or more sources.
4

5 **BACKGROUND**

6 As hard drive storage space on computer systems increases, users are
7 storing more media items on their computer systems. These media items include
8 music files, video files, and streaming media links (e.g., Internet radio stations).
9 When a user wants to play a particular media item, the user wants to quickly and
10 easily select the desired media item from hundreds or thousands of different media
11 items. An unstructured listing of media items would frustrate the user having to
12 sort through a large number of media items individually.

13 The media items stored on a particular computer system may be accessed
14 by different application programs. If each application program uses a different
15 media selection mechanism, it may be tedious for the user to learn several
16 different media selection mechanisms. Using different media selection
17 mechanisms to access the same media data is inefficient from a computing
18 standpoint.

19 Accordingly, it is desirable to provide a media selection mechanism that is
20 efficient to implement and is consistent across different application programs.
21

22 **SUMMARY**

23 The systems and methods described herein provide an efficient media
24 selection mechanism that uses a consistent user experience across multiple
25 applications or components. A common media access server identifies and stores

1 various media data. A media access client accesses media data from the media
2 access server. The media access clients aggregate and categorize the media data
3 received from the media access server. Media access clients also display the
4 media data to a user in a consistent manner using a common user interface.

5 In a particular embodiment, a graphical user interface for a media player
6 includes a button associated with accessing media stored on a computing system.
7 An actuation mechanism enables a user to select the button, which causes the
8 media player to obtain information regarding media available to the user and to
9 display the information regarding media available to the user in a hierarchical
10 manner.

11 In another embodiment, a request for media data is received from a media
12 access client. In response to the request, one or more stored media items and one
13 or more stored media lists are identified. Information regarding the one or more
14 stored media items and the one or more stored media lists are provided to the
15 media access client.

16 17 **BRIEF DESCRIPTION OF THE DRAWINGS**

18 Similar reference numbers are used throughout the figures to reference like
19 components and/or features.

20 Fig. 1 is a block diagram of an example computing environment.

21 Fig. 2 is a flow diagram illustrating an embodiment of a procedure for
22 aggregating media data and allowing clients to access the aggregated media data.

23 Fig. 3 is a flow diagram illustrating an embodiment of a procedure for
24 identifying various media information.
25

1 Fig. 4 illustrates an example of a user interface generated by a media player
2 application.

3 Fig. 5 illustrates an example of a user interface generated by a secondary
4 media player application.

5 Fig. 6 illustrates an example of a user interface generated by an online
6 services application.

7 Fig. 7 illustrates a general computer environment, which can be used to
8 implement the techniques described herein.

9 10 **DETAILED DESCRIPTION**

11 The methods and systems discussed herein provide a scalable component
12 that aggregates and categorizes media data, such as audio files, video files,
13 playlists, and media devices. The methods and systems organize the media
14 information and respond to user interaction to provide a quick media selection
15 mechanism for choosing media from potentially thousands of media items and
16 other media data stored in a computer system. The user interface control can be
17 implemented in a variety of different components within multiple application
18 environments to provide a consistent user interface across a user's computer
19 system.

20 As used herein, an "audio file" is any file containing any audio data and a
21 "video file" is a file containing any video data. A "media list" is a list of audio
22 files, video files or other information related to, for example, a particular artist, a
23 particular album, or a particular genre. Another type of media list is a "playlist".
24 A "playlist" is any listing of audio files, video files, or other data files that may not
25 have any particular relationship to one another. Particular examples of playlists

1 are discussed below. A "media device" is any device capable of generating,
2 recording and/or communicating media data. Example media devices include CD
3 Drives, DVD Drives, portable audio players, televisions, and radio broadcasts. As
4 used herein, a "media item" is any audio data, video data, streaming media link, or
5 other data that represents or identifies a media source.

6 Fig. 1 is a block diagram of an example computing environment 100. A
7 media player 102 is coupled to an online service application 104 and a secondary
8 media player 106. Media player 102 is also coupled to a media database 108 and
9 two media devices 110 and 112. Media player 102 can be any type of media
10 recording and/or playback application, such as the Windows Media[®] Player
11 available from Microsoft Corporation of Redmond, Washington. Online service
12 application 104 provides access to various online services. In one embodiment,
13 online service application 104 is the MSN[®] network of Internet services supported
14 by Microsoft Corporation. Secondary media player 106 may be associated with
15 media player 102. For example, secondary media player 106 may generate an
16 icon/interface, which is positioned in a task bar when media player 102 is
17 minimized. An example secondary media player icon/interface is shown in Fig. 5.

18 Media player 102 is capable of receiving, storing and playing various media
19 items, such as audio files and video files. Media player 102 includes a user
20 interface generator 114 coupled to a media access client 116, which is coupled to a
21 media access server 118. Media access server 118 receives media data from a
22 variety of sources, such as media devices 110 and 112. Media devices 110 and
23 112 may be CD players (or CD drives), DVD players (or DVD drives), or other
24 devices capable of providing media data to media access server 118. Media
25 devices 110 and 112 may be permanently installed in the computing system (e.g., a

1 CD drive or a DVD drive) or may be temporarily coupled to the computing system
2 (e.g., a portable music player coupled to the computing system via a universal
3 serial bus (USB) connection). Media access server 118 stores media data to media
4 database 108 and retrieves stored media data from media database 108. Media
5 database 108 can also store other information, such as configuration information,
6 used by media access server 118 and media player 102.

7 Media access client 116 receives information from media access server 118.
8 The received information is aggregated and categorized for use by user interface
9 generator 114. User interface generator 114 generates a user interface for display
10 on a display device, such as a computer monitor. The user interface allows a
11 computer user to select a particular media item by, for example, navigating
12 through a hierarchy of media items.

13 Online service application 104 includes a media access client 120 coupled
14 to a user interface generator 122. Media access client 120 receives information
15 from media access server 118. The received information is aggregated and
16 categorized for use by user interface generator 122. User interface generator 122
17 generates a user interface for display on a display device, such as a computer
18 monitor. Similar to user interface generator 114, user interface generator 122
19 generates a user interface that allows a computer user to select a particular media
20 item by, for example, navigating through a hierarchy of media items.

21 Secondary media player 106 includes a media access client 124 coupled to
22 a user interface generator 126. Media access client 124 receives information from
23 media access server 118. The received information is aggregated and categorized
24 for use by user interface generator 126. User interface generator 126 generates a
25 user interface for display on a display device, such as a computer monitor. Similar

1 to user interface generator 114, user interface generator 126 generates a user
2 interface that allows a computer user to select a particular media item by, for
3 example, navigating through a hierarchy of media items.

4 As shown in Fig. 1, multiple media access clients 116, 120 and 124 access a
5 common media access server 118. Thus, rather than providing a separate media
6 access server for each application or component in a computing system that
7 handles media items, a single media access server provides the necessary server
8 functions for any number of media access clients.

9 In a particular embodiment, a computer system includes one
10 implementation of media access client 116 (shown in media player 102). This
11 media access client is used by other applications, such as online service
12 application 104 and secondary media player 106. In this embodiment, media
13 access client 120 and media access client 124 are instantiations of media access
14 client 116.

15 Similarly, a computer system may include one implementation of user
16 interface generator 114 (shown in media player 102). The user interface generator
17 is used by other applications. In this embodiment, user interface generator 122
18 and user interface generator 126 are instantiations of user interface generator 114.

19 Fig. 2 is a flow diagram illustrating an embodiment of a procedure 200 for
20 aggregating media data and allowing clients to access the aggregated media data.
21 Initially, a media access server receives a request for media data from a media
22 access client (block 202). The request for media data may be generated, for
23 example, by a user request to play a media item or access a media device. The
24 media access server identifies media items, media lists and media devices stored
25 on or coupled to a computing system (block 204). The media access server then

1 provides data regarding the identified media items, media lists and media devices
2 to the requesting media access client (block 206). The media access server does
3 not necessarily retrieve the actual media data. Instead, information regarding the
4 media data is identified and provided to the media access client. For example,
5 instead of providing a music file to the media access client, the media access
6 server provides information regarding the music file, such as title, author, etc.

7 The requesting media access client receives the data from the media access
8 server. The requesting media access client then aggregates and categorizes the
9 received data and displays the data using the user interface generator (block 208).
10 This aggregation and categorization of media data eliminates the need for a user to
11 have prior knowledge of the physical location of media items, media playlists
12 and/or media devices by aggregating the media data into a single user interface.
13 Categorizing the aggregated data aids the user in selecting one or more desired
14 media items, playlists, or devices. For example, media data can be categorized by
15 artist name, album name, genre, and the like. Example user interfaces are
16 discussed below with respect to Figs. 4-6.

17 A user of the computing system makes a media selection using the user
18 interface generated by the user interface generator (block 210). The user's
19 selection is processed by the media access client and the necessary operation is
20 communicated to the media access server (block 212). The media access server
21 then executes the necessary operation (block 214), such as playing a selected
22 media item or activating a media device.

23 In an example implementation of the procedure described above, a user of
24 online service application 104 (Fig. 1) activates (e.g., launches) media access
25 client 120. Media access client 120 sends a request for media data to media access

1 server 118. Media access client 120 receives media data regarding various media
2 items, media lists and media devices accessible through media access server 118.
3 Media access client generates a user interface using user interface generator 122.
4 The user of online service application 104 selects a media item, media list or
5 media device via the user interface. The user's selection is then processed and the
6 appropriate operation is performed. For example, if the user selected a particular
7 song to play, that song is played for the user. Alternatively, if the user selected a
8 particular media device, the audio or video data contained in that media device is
9 played for the user.

10 In the embodiment discussed above, the media access client aggregates and
11 categorizes media data received from the media access server. In an alternate
12 embodiment, the media access server aggregates and categorizes the media data
13 prior to providing the media data to the media access client. In this embodiment,
14 the aggregation and categorization tasks are shifted to the media access server,
15 thereby simplifying the tasks to be performed by the media access clients.

16 Fig. 3 is a flow diagram illustrating an embodiment of a procedure 300 for
17 identifying various media information. In the example of Fig. 3, procedure 300 is
18 performed by a media access server. In alternate embodiments, one or more other
19 devices may perform procedure 300. Initially, a media access server identifies
20 media items, such as audio files and video files, stored in a media database (block
21 302). These media items may include an associated title, artist, genre, duration
22 and other information that may be of interest to a user selecting a media item or a
23 system that is categorizing multiple media items.

24 The media access server also identifies media lists stored in the media
25 database (block 304). The process of identifying media lists may include several

1 separate operations, as shown in Fig. 3. The media access server identifies media
2 lists associated with particular artists (block 306) and identifies media lists
3 associated with particular albums (block 308). Media lists associated with
4 particular artists may be collections of audio files or video files associated with
5 particular artists, such as Green Day, Nickelback, Pink Floyd, U2, etc. Media lists
6 associated with particular albums typically include collections of audio files or
7 video files originally copied or “sourced” from the same CD, DVD, or other
8 source. An example media list associated with a particular album includes Our
9 Garden, Greatest Hits, The Train Wreck, New Town Dog, Moonlight Haze, etc.

10 The media access server also identifies media lists associated with
11 particular genres (block 310), such as music genres, and identifies user-specified
12 playlists (block 312). Media lists associated with particular genres may include
13 audio files related to a similar genre of music, such as Classical, Country, Jazz,
14 Rock or Soundtracks. Media lists associated with user-specified playlists include,
15 for example, collections of audio or video files created by the user. Example
16 playlists include favorite rock songs, movie songs, high energy music and favorite
17 movie clips.

18 Another type of playlist that can be accessed by the media access server is
19 an automatically generated playlist. An automatically generated playlist is created
20 based on a user’s viewing and/or listening habits or other factors. Examples
21 include a playlist of songs typically listened to in the evening, a playlist of fresh
22 (e.g., recently copied to the computer) music tracks, unrated music tracks, and
23 unrated video clips.

24 Referring again to Fig. 3, the procedure continues at block 314 where the
25 media access server identifies streaming media links. These streaming media links

1 may include network-based radio station presets (e.g., Internet radio stations).
2 These streaming media links can be assigned by a user of the computer, installed
3 automatically based on user preferences or listening habits, or installed as default
4 presets. Example streaming media links include Online Jazz, MSNBC, Oldies
5 Radio, 80s Radio, 90s Radio, etc.

6 Finally, the media access server identifies media devices coupled to the
7 computing system (block 316). Media devices include, for example, CD Drives,
8 DVD Drives, portable audio players, portable video players, and the like.
9 Information regarding the identified media items, media lists, streaming media
10 links and media devices can be stored in the media database 108 (Fig. 1) for future
11 access by the media access server.

12 Particular embodiments discussed herein identify media items, media lists,
13 streaming media links and media devices in response to a request for such data
14 from a media access client. This identification of media information may be
15 performed in response to each request from a media access client. In an alternate
16 embodiment, the media information may be identified periodically and stored
17 (e.g., cached) for use in response to requests from media access clients.

18 Fig. 4 illustrates an example of a user interface generated by a media player
19 application. In the example of Fig. 4, the media player application is the Windows
20 Media[®] Player available from Microsoft Corporation. The user interface
21 displayed by the media player application includes a triangular button 402 to the
22 right of the "Now Playing" button. When a user moves a cursor (such as a mouse
23 cursor) over triangular button 402, the appearance of the triangular button changes
24 (e.g., the button is highlighted) to indicate that the user can interact with the button
25

1 by clicking on the button. The appearance of triangular button 402 changes back
2 to its original appearance when the cursor moves away from the triangular button.

3 If a user activates triangular button 402 (e.g., by clicking a mouse button
4 while the mouse cursor is positioned over triangular button 402), a window 404
5 opens. The information contained in window 404 allows a user to access any
6 media item, playlist, or media device stored on or coupled to the computer system.
7 The top of window 404 illustrates media drives available on the computer system
8 and the media content currently in the drive (e.g., A Christmas Album (G:)).
9 Window 404 also displays a listing of media items by Album, Artist and Genre,
10 User Playlists, Auto Playlists, Radio Stations (e.g., streaming media sources), and
11 complete listings of all music and all video on the computer system. If the user
12 selects a media drive (e.g., G:), the media player application begins playing the
13 media currently in the media drive. If the user selects "Albums", a listing of
14 albums stored on the computer system (e.g., in a media database) is displayed for
15 the user. Selecting a particular album from the list causes the media player
16 application to begin playing songs or video content associated with the selected
17 album. If the user selects "Artists", a listing of artists stored on the computer
18 system is displayed. In the example of Fig. 4, another window 406 is opened to
19 display the list of artists available to the media player application. Selecting a
20 particular artist in window 406 causes the media player application to begin
21 playing songs or video content associated with that artist.

22 If the user selects "Genres", a listing of various genres of music stored on
23 the computer system is displayed. Selecting a particular genre from the list causes
24 the media player application to begin playing songs associated with the selected
25 genre. If the user selects "My Playlists", a listing of user playlists stored on the

1 computer system is displayed. Selecting a particular playlist causes the media
2 player application to begin playing songs from the selected playlist. If the user
3 selects "Auto Playlists", a listing of automatically generated playlists stored on the
4 computer system is displayed. Selecting a particular auto playlist causes the
5 media player application to begin playing songs from the auto playlist.

6 If the user selects "Radio Stations", a listing of various network-based radio
7 stations (such as Internet radio stations) is displayed. Selecting a particular
8 network-based radio station from the list causes the media player application to
9 access the streaming media link associated with the network-based radio station.
10 If the user selects "All Music", a listing of all audio files stored on the computer
11 system is displayed. Selecting a particular audio file from the list causes the
12 media player application to begin playing the selected audio file. If the user
13 selects "All Video", a listing of all video files stored on the computer system is
14 displayed. Selecting a particular video file from the list causes the media player
15 application to begin playing the selected video file.

16 The user interface shown in Fig. 4 allows a user to quickly access any type
17 of media content stored on the computer system. In one embodiment, the user
18 interface shown in Fig. 4 is provided in addition to other interface features
19 commonly available through a media player application. In this embodiment, one
20 or more of the features of the user interface shown in Fig. 4 may be redundant
21 with interface features offered by the media player application.

22 The hierarchy shown in Fig. 4 allows a user to easily navigate through a
23 large number of audio and/or video files stored on the computer system. Although
24 the user has access to all media items, playlists and media devices associated with
25 the computer system, the user can quickly select a particular file or group of files

1 (e.g., playlist, all files on an album or all files associated with a particular artist)
2 for playback.

3 Fig. 5 illustrates an example of a user interface generated by a secondary
4 media player application. As mentioned above, the secondary media player may
5 be associated with another media player application. In one embodiment, the
6 secondary media player is a task bar media player which is represented as an
7 icon/interface in a task bar when the primary media player application (e.g., media
8 player 102) is minimized. The icon/interface is represented by reference number
9 502 in Fig. 5, which shows the icon/interface in a task bar 504 of a Windows[®]
10 screen. When a button 506 is activated in icon/interface 502, a window 508 opens.
11 Window 508 contains content similar to the information displayed in window 404
12 (Fig. 4). The content in window 508 is similar to the content in window 404
13 because the media data used to generate the windows is obtained from the same
14 media access server. This similarity in windows 508 and 404 enhances the user's
15 experience with the computer system because the user need not learn a different
16 user interface for different media players. When different instances of the same
17 application are identical, the user is presented with the same user interface. Thus,
18 the user can perform identical actions to operate the user interface. When a user
19 selects one of the items listed in window 508, an action is taken as discussed
20 above with respect to Fig. 4. For example, if the user selects "Artists" in window
21 508, another window 510 opens that contains a listing of artists stored on the
22 computer system is displayed to the user of the computer system.

23 Fig. 6 illustrates an example of a user interface generated by an online
24 services application. In one embodiment, the online services application is the
25 MSN[®] network of Internet services supported by Microsoft Corporation. Fig. 6

1 illustrates a logon (or home) screen 602 displayed to users of the online services
2 application. When a media button 604 is activated by a user, a window 606 is
3 displayed. Window 606 contains content similar to (or identical to) the
4 information displayed in window 404 (Fig. 4) and window 508 (Fig. 5). The
5 content in window 606 is similar to the content in windows 404 and 508 because
6 the media data used to generate the windows is obtained from the same media
7 access server. This similarity in windows 606, 508 and 404 enhances the user's
8 experience with the computer system because the user need not learn a different
9 user interface for different media-related applications. When a user selects one of
10 the items listed in window 606, an action is taken as discussed above with respect
11 to Fig. 4. For example, if the user selects "Artists" in window 606, another
12 window 608 opens that contains a listing of artists stored on the computer system
13 is displayed to the user of the computer system.

14 Fig. 7 illustrates a general computer environment 700, which can be used to
15 implement the techniques described herein. The computer environment 700 is
16 only one example of a computing environment and is not intended to suggest any
17 limitation as to the scope of use or functionality of the computer and network
18 architectures. Neither should the computer environment 700 be interpreted as
19 having any dependency or requirement relating to any one or combination of
20 components illustrated in the example computer environment 700.

21 Computer environment 700 includes a general-purpose computing device in
22 the form of a computer 702. The components of computer 702 can include, but
23 are not limited to, one or more processors or processing units 704 (optionally
24 including a cryptographic processor or co-processor), a system memory 706, and a
25

1 system bus 708 that couples various system components including the processor
2 704 to the system memory 706.

3 The system bus 708 represents one or more of any of several types of bus
4 structures, including a memory bus or memory controller, a peripheral bus, an
5 accelerated graphics port, and a processor or local bus using any of a variety of
6 bus architectures. By way of example, such architectures can include an Industry
7 Standard Architecture (ISA) bus, a Micro Channel Architecture (MCA) bus, an
8 Enhanced ISA (EISA) bus, a Video Electronics Standards Association (VESA)
9 local bus, and a Peripheral Component Interconnects (PCI) bus also known as a
10 Mezzanine bus.

11 Computer 702 typically includes a variety of computer readable media.
12 Such media can be any available media that is accessible by computer 702 and
13 includes both volatile and non-volatile media, removable and non-removable
14 media.

15 The system memory 706 includes computer readable media in the form of
16 volatile memory, such as random access memory (RAM) 710, and/or non-volatile
17 memory, such as read only memory (ROM) 712. A basic input/output system
18 (BIOS) 714, containing the basic routines that help to transfer information
19 between elements within computer 702, such as during start-up, is stored in ROM
20 712. RAM 710 typically contains data and/or program modules that are
21 immediately accessible to and/or presently operated on by the processing unit 704.

22 Computer 702 may also include other removable/non-removable,
23 volatile/non-volatile computer storage media. By way of example, Fig. 7
24 illustrates a hard disk drive 716 for reading from and writing to a non-removable,
25 non-volatile magnetic media (not shown), a magnetic disk drive 718 for reading

1 from and writing to a removable, non-volatile magnetic disk 720 (e.g., a “floppy
2 disk”), and an optical disk drive 722 for reading from and/or writing to a
3 removable, non-volatile optical disk 724 such as a CD-ROM, DVD-ROM, or other
4 optical media. The hard disk drive 716, magnetic disk drive 718, and optical disk
5 drive 722 are each connected to the system bus 708 by one or more data media
6 interfaces 726. Alternatively, the hard disk drive 716, magnetic disk drive 718,
7 and optical disk drive 722 can be connected to the system bus 708 by one or more
8 interfaces (not shown).

9 The disk drives and their associated computer-readable media provide non-
10 volatile storage of computer readable instructions, data structures, program
11 modules, and other data for computer 702. Although the example illustrates a hard
12 disk 716, a removable magnetic disk 720, and a removable optical disk 724, it is to
13 be appreciated that other types of computer readable media which can store data
14 that is accessible by a computer, such as magnetic cassettes or other magnetic
15 storage devices, flash memory cards, CD-ROM, digital versatile disks (DVD) or
16 other optical storage, random access memories (RAM), read only memories
17 (ROM), electrically erasable programmable read-only memory (EEPROM), and
18 the like, can also be utilized to implement the example computing system and
19 environment.

20 Any number of program modules can be stored on the hard disk 716,
21 magnetic disk 720, optical disk 724, ROM 712, and/or RAM 710, including by
22 way of example, an operating system 726, one or more application programs 728,
23 other program modules 730, and program data 732. Each of such operating
24 system 726, one or more application programs 728, other program modules 730,
25

1 and program data 732 (or some combination thereof) may implement all or part of
2 the resident components that support the distributed file system.

3 A user can enter commands and information into computer 702 via input
4 devices such as a keyboard 734 and a pointing device 736 (e.g., a "mouse").
5 Other input devices 738 (not shown specifically) may include a microphone,
6 joystick, game pad, satellite dish, serial port, scanner, and/or the like. These and
7 other input devices are connected to the processing unit 704 via input/output
8 interfaces 740 that are coupled to the system bus 708, but may be connected by
9 other interface and bus structures, such as a parallel port, game port, or a universal
10 serial bus (USB).

11 A monitor 742 or other type of display device can also be connected to the
12 system bus 708 via an interface, such as a video adapter 744. In addition to the
13 monitor 742, other output peripheral devices can include components such as
14 speakers (not shown) and a printer 746 which can be connected to computer 702
15 via the input/output interfaces 740.

16 Computer 702 can operate in a networked environment using logical
17 connections to one or more remote computers, such as a remote computing device
18 748. By way of example, the remote computing device 748 can be a personal
19 computer, portable computer, a server, a router, a network computer, a peer device
20 or other common network node, game console, and the like. The remote
21 computing device 748 is illustrated as a portable computer that can include many
22 or all of the elements and features described herein relative to computer 702.

23 Logical connections between computer 702 and the remote computer 748
24 are depicted as a local area network (LAN) 750 and a general wide area network
25

1 (WAN) 752. Such networking environments are commonplace in offices,
2 enterprise-wide computer networks, intranets, and the Internet.

3 When implemented in a LAN networking environment, the computer 702 is
4 connected to a local network 750 via a network interface or adapter 754. When
5 implemented in a WAN networking environment, the computer 702 typically
6 includes a modem 756 or other means for establishing communications over the
7 wide network 752. The modem 756, which can be internal or external to computer
8 702, can be connected to the system bus 708 via the input/output interfaces 740 or
9 other appropriate mechanisms. It is to be appreciated that the illustrated network
10 connections are exemplary and that other means of establishing communication
11 link(s) between the computers 702 and 748 can be employed.

12 In a networked environment, such as that illustrated with computing
13 environment 700, program modules depicted relative to the computer 702, or
14 portions thereof, may be stored in a remote memory storage device. By way of
15 example, remote application programs 758 reside on a memory device of remote
16 computer 748. For purposes of illustration, application programs and other
17 executable program components such as the operating system are illustrated herein
18 as discrete blocks, although it is recognized that such programs and components
19 reside at various times in different storage components of the computing device
20 702, and are executed by the data processor(s) of the computer.

21 Various modules and techniques may be described herein in the general
22 context of computer-executable instructions, such as program modules, executed
23 by one or more computers or other devices. Generally, program modules include
24 routines, programs, objects, components, data structures, etc. that perform
25 particular tasks or implement particular abstract data types. Typically, the

1 functionality of the program modules may be combined or distributed as desired in
2 various embodiments.

3 An implementation of these modules and techniques may be stored on or
4 transmitted across some form of computer readable media. Computer readable
5 media can be any available media that can be accessed by a computer. By way of
6 example, and not limitation, computer readable media may comprise "computer
7 storage media" and "communications media."

8 "Computer storage media" includes volatile and non-volatile, removable
9 and non-removable media implemented in any method or technology for storage
10 of information such as computer readable instructions, data structures, program
11 modules, or other data. Computer storage media includes, but is not limited to,
12 RAM, ROM, EEPROM, flash memory or other memory technology, CD-ROM,
13 digital versatile disks (DVD) or other optical storage, magnetic cassettes, magnetic
14 tape, magnetic disk storage or other magnetic storage devices, or any other
15 medium which can be used to store the desired information and which can be
16 accessed by a computer.

17 "Communication media" typically embodies computer readable
18 instructions, data structures, program modules, or other data in a modulated data
19 signal, such as carrier wave or other transport mechanism. Communication media
20 also includes any information delivery media. The term "modulated data signal"
21 means a signal that has one or more of its characteristics set or changed in such a
22 manner as to encode information in the signal. By way of example, and not
23 limitation, communication media includes wired media such as a wired network or
24 direct-wired connection, and wireless media such as acoustic, RF, infrared, and
25

1 other wireless media. Combinations of any of the above are also included within
2 the scope of computer readable media.

3 Although the description above uses language that is specific to structural
4 features and/or methodological acts, it is to be understood that the invention
5 defined in the appended claims is not limited to the specific features or acts
6 described. Rather, the specific features and acts are disclosed as exemplary forms
7 of implementing the invention.
